They may also be used as baking additives, for treating starch (in production of high-fructose corn syrup or ethanol) and for treating grain (to reduce fibre during mill'---

The cellulase c be used in a detergent composition, as an additive for animal feed and for the treatment of textiles or pulp and paper. The DNA encoding the cellulase can be used to identify homologous cellulases and for recombinant production of cellulases. The present sequence represents DNA encoding a cellulase from Actinomycetes.

The cellulase of be used in a detergent composition, as an additive for animal feed and for the treatment of textiles or pulp and paper. The DNA encoding the cellulase can be used to identify homologous cellulases and for recombinant production of cellulases. The present sequence represents the DNA sequence of a complete expression cassette consisting of the promoter, celA signal sequence, cellulase 11AG8 and GI terminator
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            A novel Actinomocyes cellulase and related DNA, useful for detergent compositions, treating textiles and paper or \operatorname{pulp}

The invention concerns collagen-like polymers having repetitive triads with reduced proline content, and where glycine is the initial amino acid and the subsequent amino acids are varied. The choice of triads utilised in a recombinant collagen-like polymer are chosen in order to affect properties such as helix stability, hydration, solubility, gel

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         point, biodegradation and immunogenicity. Triads of particular interest include GAP, GPA, GPP, GAS, GPG, GPS, GAO, GSP, GLQ, GSP, GPK, GAK, GAR, GER, GER, GEP, GDA, GAH and GEA. The collagen-like polymers may impart new characteristics, finding wide used in photographic, medical, structural and fibre applications, and are capable of being produced in unicellular microorganisms at high mol. wts. and in high efficiency. Plasmid DNA from several colonies were analysed for inserts contg. multiple A6 DNA fragments by digestion with Fokl. The present sequence, was identified to contain the SequenceD gene 1 monomer sequence C2A24C2. The SequenceD collagen-like polymers are used as immunogens for the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present sequence is a putative coding sequence for the wheat 1-deoxy-D-xylulose 5-phosphate synthase enzyme (DXPS). Its protein is involved in the isoprenoid biosynthesis pathway. The cDNA was identified by sequencing a number of clones and then comparing their protein sequences to known proteins: this showed the sequence's similarity to the Capsicum annuum DXPS sequence. The DXPS gene and protein can be used to create transgenic plants which express the gene at either different levels or at different stages of development compared to normal, and to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Claim 2; Page 67; 73pp; English.

                                                                                                                                                                                                                                                                                                                                 The sequences given in AAQ43030-34 encode examples of recombinantly produced DCP collagen-like polymers (CLPs) which consist of repeated tripeptide sequences selected from a wide range of GXY sequences, where X and Y can be any amino acid. These sequences can be cloned into plasmids and used to transform E. coli to produce the DCP proteins. DCP peptides comprise repeated units of; A = GAPGPAGPP, B = GSRGDPGPP and/Or C = GAHGPAGPX. These polymers may be used to raise anti-DCP antibodies in rabbits. These polymers have molecular weights of >30 kD and are able to form helices due to interchain C linkages. These polymers pref. contain a proportion of tripeptide triad sequences found in natural collagens, pref. mammalian collagens. The CLPs impart unique characteristics to materials such as fibres, membranes, films, coatings, hydrogels, colloid suspensions and moulded

                                                                                                                                                  This sequence encodes an immunogenic portion of a soluble Mycobacterium tuberculosis (MT) antigen which can be used in a method for inducing protective immunity against tuberculosis (TB). This sequence can be formulated into vaccines and/or pharmaceutical compositions for immunising against M. tuberculosis infection or may be used for the diagnosis of tuberculosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Campos-Neto A, Dillor Reed SG, Skeiky YAW,

The invention relates to methods and compositions for diagnosing tuberculosis. It provides polypeptides (see AAW64291-W64379) comprising an antigenic portion of a soluble M. tuberculosis antigen, or an immunogenic portion of a M. tuberculosis antigen, as well as DNA sequences encoding such polypeptides, recombinant expression vectors and transformed or transfected host cells. Also claimed are methods and diagnostic kits for detecting M. tuberculosis infection in a patient using these polypeptides, antibodies or oligonucleotide probes and crimers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Mycobacterium tuberculosis antigen XP25; 5' DNA is provided in AAV44438. XP25 DNA was isolated from a M. tuberculosis strain Erdman genomic DNA expression library using sera from partients having extrapulmonary tuberculosis. It bears no similarity to known

Also described are vaccines and fusion protein containing M. tuberculosis Ag's.

M. tuberculosis Ag's, DNAs encoding them, derived fusion proteins and other polypeptides fragments, can be used in pharmaceutical compositions or vaccines to generate a protective or therapeutic immune response to M. tuberculosis and as reagents in skin tests for diagnosis of
                                                                                                                                                                                                                                                                                                                                                                    tuberculosis. Ag can induce proliferation of, or cytokine secretion by, T, B or natural killer cells and/or macrophages in tuberculosis-immune subjects. AAZ19249 to AAZ19460 and AAX39083 to

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Antigen; vaccine;
                                                                                                                                                                                                  Sequence 985 BP; 138 A; 330 C; 423 G; 94 T; 0 other;
                                                                                                                                                                                                                                             nucleic acids derived from Mycobacterium tuberculosis. The novel polypeptides are useful for detecting M. tuberculosis infection in a biological sample by detecting antibodies which bind with the polypeptides, and are useful as vaccines for immunizing against M. tuberculosis infection. The new detection methods are needed as current vaccination strategies do not provide 100% immunity.
                                                                                                                                                                                                                                                                                                                                                                                               This invention describes novel recombinant antigens and their encoding
                                                                                                                                                                                                                                                                                                                                                                                                                                                     Claim 4;

everninomicin pathway gene (a bottle-neck gene) into an actinomycete of the genus Micromonospora. The DNA encoding the biosynthetic proteins is useful for synthesising novel everninomicin-related compounds, arising from modifications of the DNA sequence designed to change glycosyl and modified orsellinic acid groups contained in everninomicin, for expressing functional or mutant everninomic in biosynthetic enzyme for evaluation, diagnosis and preferably biosynthesis of everninomicin or other secondary metabolic products, improving the yield of everninomicins and to produce novel everninomicins and also as a hybridisation probe to identify homologous sequences. The encoded polypeptides are useful for combinatorial biosynthesis to generate libraries of orthomycins, e.g. everninomicin analogues/homologues and drug discovery. The DNA encoding the integrase allows for increasing a given gene dosage. The integrative vector can be used to permanently integrate copies of a possible of a contract of the contract of the product of the contract of t
                                                                                                                                                                                                                                                                                                                                                                                                                                              The sequence encodes 11 proteins comprising enzymes of the everninomicin antibiotic biosynthetic pathway. A vector comprising a M. carbonacea everninomicin biosynthetic pathway resistance gene product is useful for selecting for a transfected or transformed host cell. An integrative version of the vector is useful for introducing a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New nucleic acid molecules encoding everninomicin pathway gene products, useful for improving yields of everninomicin, to proeverninomicin and as probes to identify homologous sequences -

Mycobacterium tuberculosis or related Mycobacterium by determining the nucleotide sequence of the first strain at positions in the complete sequence of the genome that correspond to positions that differ in the nucleotide sequences of M. tuberculosis strains CDC 1551 (AAI99683) and 137Rv (AAI99682). The method is useful for evaluating strain variation of the control of the sequences of M. tuberculosis and has valuable application in the fields of the control of the co
                                                                                                                Streptomyces
                                                                                                                                                                                                               AAT93095 standard;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Note: The sequence data for this patent did not form part of t specification, but was obtained in electronic format directly at seqdata.uspto.gov/sequence.html?DocID=6294328B1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Claim

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       This DNA sequence comprises the Streptomyces frenolicin gene collister containing specifically claimed coding sequences (genes CC A-U) that respectively encode 21 proteins (see AAW34199-219) involved CC in frenolicin synthesis. The genes can be divided into 5 subclusters: (1) genes A, B, C, D and F encode an efflux pump; (2) genes H, I, J and K encode butyrate starter synthases; (3) genes CC L, M and N encode polyketide synthases (PKS); (4) genes O, P, Q and CR encode a hemiketalase, a ketoreductase and cyclases/dehydrases; CC and (5) genes S and T encode a keto/enoyl reductase and a hydrolase. Also claimed are vectors, host cells (especially a CC streptomyces sp., particularly Streptomyces roseofulvus), and the cencoded proteins. Cells transformed using the above sequence can be cultured to produce frenolicins or frenolicin precursors. The methods. The frenolicins can be oxidised to frenolicin B, an entitled with the content of the cont
